Lung Cancer Screening

It's quick, easy and could save your life.

Lung cancer is responsible for 1 of every 3 cancer deaths and is the most common cause of cancer death in most populations. Low-Dose Chest CT (LDCT) screening can detect many small lung cancers before they are visible on a regular chest X-ray, increasing treatment options and survival rates.

By finding a lung cancer with a screening LDCT scan when the cancer is small, more effective and potentially curable treatment options become available.

Who should be screened?

Smokers age 55 to 77 years who have smoked for 30 pack-years or more (pack-year smoking history is calculated by multiplying the number of years you have smoked by the number of packs you smoke a day).

Former Smokers age 55 to 77 years who quit smoking less than 15 years ago and have smoked 30 pack-years or more.

If you are a smoker, have a history of smoking or have other risk factors for lung cancer, please contact your doctor to see if LDCT Lung Cancer Screening is appropriate for you.

For more information about this and other screening exams provided by Radiology Ltd., please visit our website at www.radltd.com.
